Is now offering a **Better** root-pruning container!

Air-Root Pruning is an old science that develops the root system at an incredible rate. The resulting root mass is impressive. Many nurseries have discovered the benefits of using air-root pruning technology and have found ways to reduce labor cost associated with incremental step-ups. Nurserymen have told us they are very happy with the growth rate, root ball development and caliper growth using air-root pruning as their standard liner production method. Some nurseries are experimenting with very aggressive step-ups that could not be accomplished without the supporting root mass.

The Better Container Growing System is designed to maximize the opportunity for air-root pruning to occur by guiding the root tips into an opening instead of relying on random chance that a root might intersect and eventually exit an opening.

## FEATURES & BENEFITS:

1. Anti-Circling, root guiding vertical channels every ¼"
2. Six vertical reinforcing ribs
3. Eight horizontal bottom root tip guides
4. Available in solid or perforated bottoms
5. Rimless to guard against trunk damage
6. Great anti-jamming stack design
7. Extremely even distribution of root pruning exits
8. Injection molded quality for durability
9. Value priced for small & large purchases
10. Locally manufactured and warehoused

The air-pruned root ball shown above demonstrates a highly fibrous feeder root development with no evidence of circling or girdling. The root balls shown below clearly illustrate the differences.
